Kang
Species: cat
Eating habit: carnivore

Instruction

Connect to your route and display it's contents via HTML and Javascript.

Tools

HTML, Bootstrap, Javascript, Node.js, Express, Visual Studio Code

Description

- Open Visual Studio Code.
- Create a new .html page. Name it **pet_shop.html**
- Title the page **Pet Shop**.
- Connect your .html file to your running Express server.
- Use internal Javascript for this activity.
- This activity is in two parts.

Pets images

- Download an image for each of the pets in **pet_store.js**.
- Update your **pet_store.js** in that each pet has a new property, **image**.
- The value assigned to image would be the file path to the image, starting from **pet_store.js**.

Pets display

- Display the contents of **GET /api/pets** wherein each entry returned by the endpoint would be displayed in cards, like so.

- Use the **pet_name** property for the heading.
- Use the **species** property for the **Species:** entry.
- Use the **eating_habit** property for the **Eating habit:** entry.
- Have all of the card pictures be of equal size. **TIP:** Use the **object-fit** and **height** CSS properties.
- The View Pet button does not have any functionality.

- Do **not** manually create static cards. Have it be automatically done by using your API and a loop.
- Compress all of your assets. Name the compressed file **ACT55.zip**
 - This includes your **pet_shop.js** and **index.js**, alongside your .html.
- Submit the .zip file here as your submission.
